in St. Petersburg

### Detailed description of the project:

Since the early nineties private used land has been privatised. As a result was build up the land cadastre, which is in a very inhomogeneous status of development. Due to a governmental decision of the year 2003 basic information about buildings shall be joined with the land cadastre into an integrated cadastre.

In the frame of the project this initiative was supported with following three main activities:

- Methodical support of joining the land cadastre with data about buildings to an integrated cadastre
- Cooperation at the readjustment of the legal framework for private licensed cadastre surveying engineers
- Support to the implementation of GPS based reference network in order to increase the efficiency of the necessary surveying activities
